# Collaboration requires more than just a phone

Are you tolerating your aging phone system simply because it "still works", or worse spending time and IT budget to maintain one that is unreliable and limiting? Can employees reliably be reached on the first try? Can they effectively collaborate with remote employees, partners or customers? Is your mobile workforce able access to business applications when they need to?

Like many departments, IT is being asked to deliver savings and a better return on investment. Even with reduced budgets, user requirements such as flexible working, collaboration, video, social media, and user device preferences are becoming increasingly complex.

Today, you should demand more from your phone system than just a dial tone. Are you hesitant to move to IP-based communications because you believe they're only for enterprise organizations with enterprise-level budgets? Have you moved to VoIP but haven't fully leveraged advanced collaboration tools?

Cisco Collaboration solutions can bring your phone, video, conferencing and messaging systems together to integrate business applications and enable employees to communicate and collaborate effectively. Built and priced specifically for organizations like yours, Cisco's IP–based Unified Communications solutions deliver these enterprise-level benefits on a smaller budget:

- Easily scale to meet your growing needs for the future

- Cut costs and boost productivity with advanced IP-based solutions

- Take advantage of the latest communication innovations, including single-number reach, instant messaging, videoconferencing, and tablets

- Improve mobile workforce productivity in a secure environment—anywhere, anytime, and on any device

Join Secant and Cisco on February 29th for an informative luncheon seminar to learn how Cisco Collaboration solutions can help you provide your employees with the right tools to effectively and securely collaborate—anywhere, anytime, and on any device.
