

## **Sacramento River Watershed Program Watershed Management Technical Assistance**

*Workshop Series May, 2012 — November, 2013*

*Held in seven regions across California*

### **Registration now open for all Workshops**

***The Sacramento River Watershed Program seeks applications to attend the Workshops. Regional registrations are due 7 days before the first scheduled Workshop in each region.***

*Space is limited—no more than 40 participants will be selected for each workshop.*

### **Watershed Monitoring and Adaptive Management**

#### **Who should attend:**

These workshops are intended for anyone interested in improving their watershed conditions. Emphasis will be on community based management and restoration of all aspects of watershed communities. Some of those we seek include:

- County and City elected officials
- State and Federal agencies
- environmental group members
- agricultural representatives
- educators
- business interests
- legislative staff
- water purveyors and managers
- recreation industry representatives
- media representatives
- developers and contractors
- planners and regulators

and others with an interest in local watershed management, and who may wish to improve their skills in community-based, locally-led environmental management.

Workshop registrants will be selected from among the applications to ensure diversity among the groups. Prior experience in watershed management is not a pre-requisite for consideration. The selected class will represent a broad range of backgrounds, management perspectives, geographic locations, occupations, experience and expertise. The applicant's desire and potential to contribute to natural resource management in their region will be an important consideration.

#### **What the Workshops will include:**

Presenters in the series will include major policy makers, agency managers and directors, non-government entities, and nationally known experts in monitoring and adaptive management. The topics are presented through lectures, interactive exercises and hands-on learning. The format of the workshops typically allows for interaction with the speakers, as well as continued interaction with other attendees during and outside of classroom activities.

#### **A sampling of topics:**

- Watershed science in management and restoration
- Performance and status monitoring
- Program management and implementation skills
- Monitoring program design and implementation
- Strategic planning and adaptive management

The **Sacramento River Watershed Program** presents the third series of Watershed Management Workshops across the state. The first series of two-day workshops has been completed in each of seven regions.

**Now accepting registration for workshop series 3 in all regions.**
